

## Poker Challenge User Manual

### Description

The program is a help tool for online poker players. It is suitable to simulate a poker tournament with fix limit raise roles and give hints for the users about their next decision according the odds and the current state.

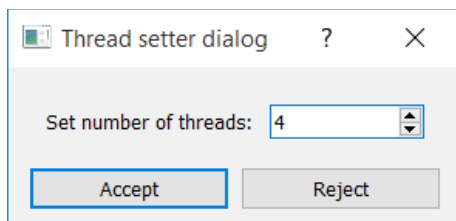

### The program has two main state:

- *The configuration state*
- *The simulating is running*

### The configuration state

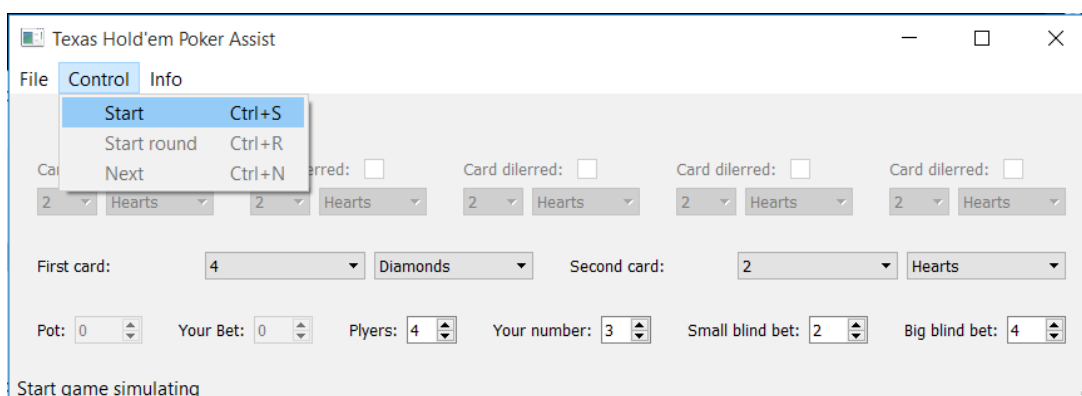

In the first state, when the simulating is stopped the user can configures the starting table options: number of players, position of user, blinds' bet, the user's hand. The position of user must be less then number of players. The big blind's bet must be twice more then small blind. You can set 10 player at most and 2 at least.

It is also able to configured the number of threads which calculate the odds on the flop and river rounds. This option can be useful on different platforms. Number of calculator threads can be modified during the simulating state.

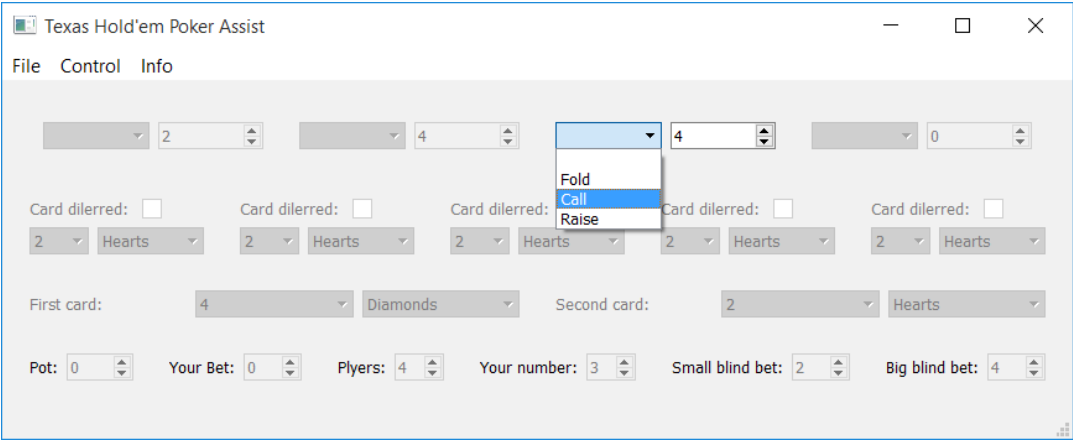

### The simulating state

The second state, when the simulating is running, the user can gives each of players decision. After the starring configuration had been selected, click to start action. (Ctrl + S).

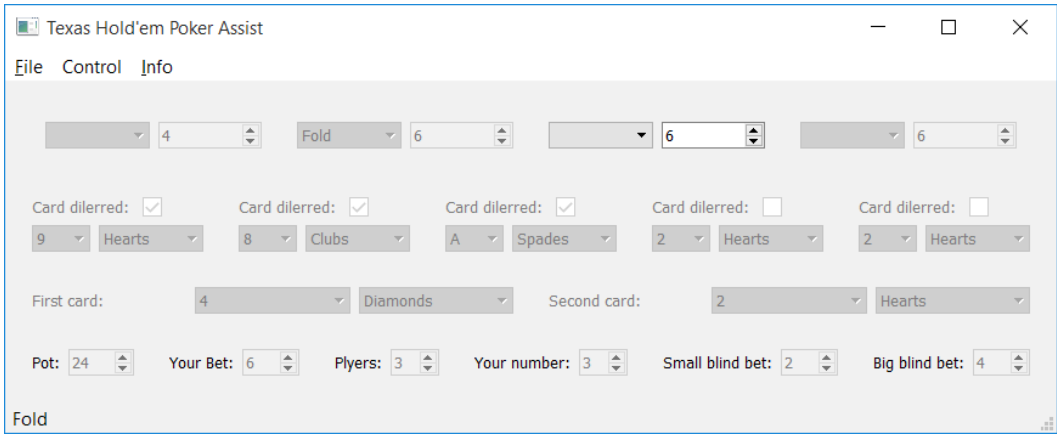

Poker challenge

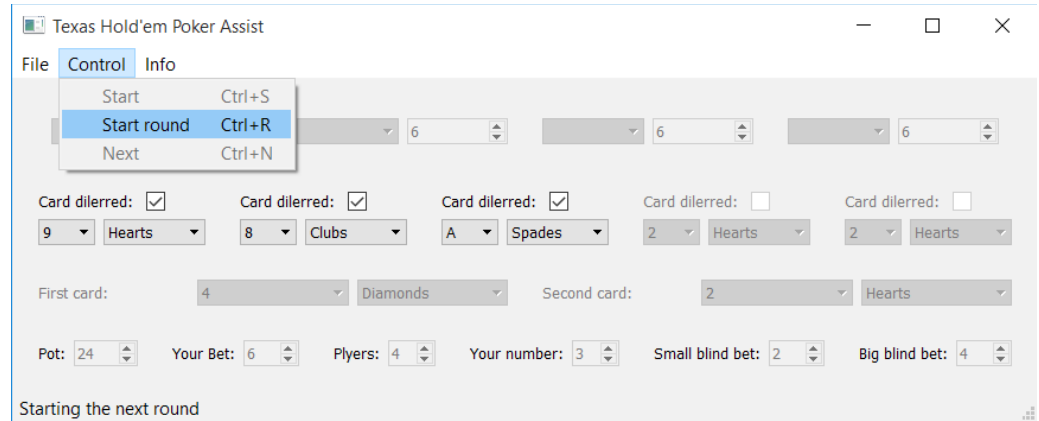

The *preflop* round will be started and the player under the gun will be enabled. Select the act (fold, call, raise) and the bet amount and click to Next action (Ctrl + N). The program is able to give error signs when the user gives wrong amount. The amount of raise is determined by the big blind's bet.

When the next position is yours so the user is on decision point, the program gives a hint what the user should do at that point. It is shown on the status bar.

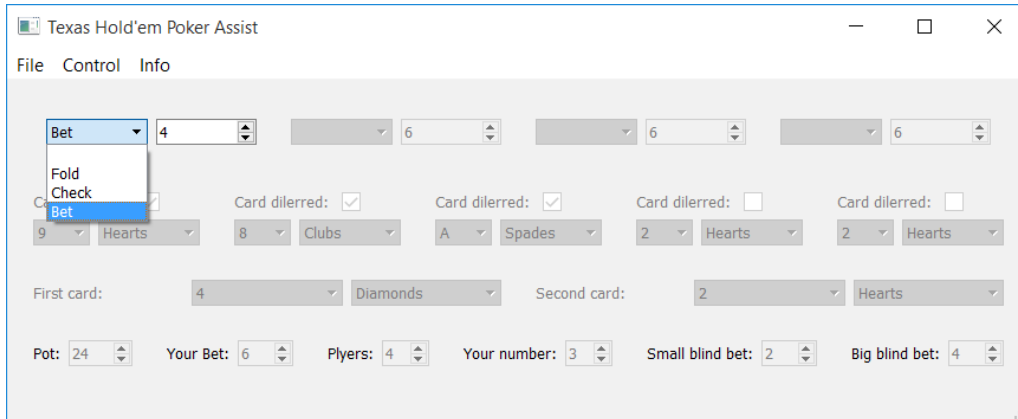

The program recognizes when a round has finished. At this point, give the dillered community cards and click to Start Round action (Ctrl + R).

## Poker challenge

The round starter active player will be enabled and you can chose from three different option. (bet, check, fold)

When someone choice bet, the betting round starts and the action list contains different options. (fold, call, raise) How you used the program in the flop round you can use it in the next rounds. The program recognizes when the game ended (end of turn round, fold your cars, you are the last player). At this point the simulating is stopping, the program resets to configuration state and a new game is able to started.
